HYGIENIC CARE AND CLEANING OF YOUR PERMANENTLY SOFT RELINED DENTURE

YOUR NEW Molloplast B relining has many advantages: It resembles natural gingival, is comfortable to wear and is resistant to mechanical pressure.

Please read carefully and follow the guidelines to maximize the use of relining dentures.

- 1) Removing the denture after each meal and rinse it well using tap water (normal)**
- 2) At least once daily the denture must be thoroughly cleaned. This is best done using a liquid soap and a soft toothbrush.**
- 3) Rinse also your mouth carefully with water after each meal, especially after drinking fruit or vegetable juice (coloring!)**
- 4) Plaque-coloring with e.g. Malachite (green) or Fuchsin (red) must be completely rinsed out of the mouth prior to reinsertion of the denture.**
- 5) After a thorough cleaning, the denture can be kept over night in a mouth rinsing solution, e.g. ACT Anti-plaque (red colored). Before re-inserting rinse well.**
- 6) Most commercial denture cleaners cause bleaching of the relined denture after a short period of time and therefore cannot be recommended.**
- 7) Please note that heavy smoking and frequent consumption of tea, coffee and wine causes discoloration and staining of the denture. Special note to smokers: Tar-containing products may cause discoloration of the relined denture.**

SMILE SERVICES:
